Future Global Warming**

Global warming is a dramatically urgent and serious problem. The four drawings represent my vision of the future “Global Warming Consequences”. Each one represents an element, heat, water, air, and nature, also animals and humanity. Consequences of; precipitation pattern changes, climate, spread diseases, hurricanes , storms, floods, droughts, less fresh water, extinct animals, and air contamination. We don’t need to wait for the government to invent or find a solution to this problem. Instead, let’s be the invention ourselves. Let’s work together and take conscience of what really is going on. Let’s save our future generations. The future is in our hands. Let’s be the cure for our planet.

Jessica F. Futuristic Vitruvian Man

This piece is relevant to the topic of futuristic technology because it becomes a more modern “futuristic” version of a da vinci’s Vitruvian Man. Da Vinci’s piece is based on the ideal human proportions. I did “ideal” fashion or appearances for the future. This piece is of a man with bionic limbs (like undergoing bionic surgery) and one seeing eye (almost like a cyborg).

Jacqueline

Salvador

In this piece everything symbolizes something. Ray Bradbury and I share similar views on the future so I wanted to show it in this piece. In this piece it shows a blindfolded skull with a rose in front. The skull represents society and technology would take once and communism would eventually would come about and no one would think for themselves. The blindfold represents a handicap, it keeps everyone from explaining life and seeing the real problem. The rose represents life and beauty and I predict that one day we won't experience that due to future technology.
